

Independent Fork Positioners

The fork positioner is a hydraulic apparatus that allows the the one driving to be able to maneuver the forklift without leaving the seat. They are made out of high quality materials and are designed to be able to withstand the most demanding operations and work surroundings. Side shifting models have the extra ability to laterally position the entire load or the arms in order to facilitate more accurate carrying and position in a quicker and more efficient method.

The fork pocket is quite unique and could enable the person operating it to be able to safely sway the blades into position without any fear of damaging the positioning cylinders. This can allow the driver the choice to execute independent or simultaneous fork movement, dependent upon the job requirement. For most forklifts with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages could be transformed into blade positioners on available units.
